

Enbuild - 1st level programming test

1. Render the Triangle for the given character and number of rows. That means if input character is D and number of rows are 4 then pyramid will be:

```
D
D E
D E F
D E F G
```

2. Write a game to "Guess the number", that means your program will generate any random number and the user will need to guess the number. In this if take the input from the user

- if user guesses the correct number (i.e. it is equal to the generated random number) then show him success message as "You have guessed the number " + number and if
- if user fails to guess then show message "Not a correct number please try again" and take the next number from the user

3. Write a program to print the first 100 prime numbers.

4. Consider one integer array. Update the array as per the following requirements:

- If the element is negative number then make the square of the number
- Keep the 0 as is
- If the number is positive even number then add the same even number to that
- If the number is positive odd number then print the next odd number to that

Ex. {0, 13, 5, -4, 6} --> {0, 15, 7, 16, 12}
